

The Diagnosis and Management of Acute Group A Streptococcal Pharyngitis in Adolescent and Pediatric Patients

Clinical Practice Guideline
MedStar Health

Antibiotic Stewardship

“These guidelines are provided to assist physicians and other clinicians in making decisions regarding the care of their patients. They are not a substitute for individual judgment brought to each clinical situation by the patient’s primary care provider in collaboration with the patient. As with all clinical reference resources, they reflect the best understanding of the science of medicine at the time of publication, but should be used with the clear understanding that continued research may result in new knowledge and recommendations.”

MedStar Pediatrics and MedStar Family Choice accept and endorse the clinical guidelines set forth by the Infectious Diseases Society of America published in 2012.

The online version of this article is available at:

http://www.idsociety.org/uploadedFiles/IDSA/Guidelines-patient_Care/PDF_Library/2012%20Strep%20Guideline.pdf

Each of the Key Points listed includes a systematic weighting of the strength of the recommendation (ie, “strong” or “weak”) and quality of evidence (ie, “high”, “moderate”, “low” or “very low”), using the GRADE (Grading of Recommendations Assessment, Development, and Evaluation) system. A detailed description of the methods, background, and evidence summaries that support each of the recommendations can be found in the full text of the guidelines.

This guideline discusses diagnosis and management of **Group A Streptococcal (GAS)** pharyngitis in Pediatric and Adolescent patients, and recommendations are provided regarding antibiotic choices and dosing.

The following selected Key Points are extracted from the guideline for **ADOLESCENT AND PEDIATRIC** patients:

- 1) Testing for GAS pharyngitis is not routinely recommended **for patients** with clinical and epidemiological features that strongly suggest a viral etiology (eg. cough, rhinorrhea, hoarseness, and oral ulcers (strong, high)). *It should be noted that GAS infection in children <3 years old is often associated with fever, mucopurulent rhinitis, excoriated nares, and diffuse adenopathy and that exudative pharyngitis is rare in this age group.*

The diagnosis of GAS pharyngitis should be established by rapid antigen detection test (RADT) and/or culture should be performed because the clinical features alone do not reliably discriminate between GAS and viral pharyngitis. In **children and adolescents**, negative RADT’s should be followed up with a throat culture (strong, high). Positive RADT’s do not necessitate a follow up culture because they are highly specific (strong, high).

- 2) Diagnostic studies for GAS pharyngitis may not be indicated for children < 3 years old because acute rheumatic fever is rare in children < 3 years old and the incidence of streptococcal pharyngitis and the classic presentation of streptococcal pharyngitis are uncommon in this age group. Selected children <

3 years old who have other risk factors (household contact with a school-aged sibling with documented GAS infection, attending day care or another setting with a high rate of cases of GAS infection, invasive retropharyngeal space infection) may be considered for testing (strong, moderate). *It should be noted that GAS infection in children <3 years old is often associated with fever, mucopurulent rhinitis, excoriated nares, and diffuse adenopathy and that exudative pharyngitis is rare in this age group.*

- 3) Penicillin or amoxicillin remain the treatments of choice.
- 4) To prevent non-suppurative complications, rheumatic fever and rheumatic heart disease, treat with the appropriate antibiotic for 10 days. The exceptions are a single IM dose of penicillin G or azithromycin for 5 days.
- 5) Penicillin-allergic individuals, without an anaphylaxis reaction, should receive a first generation cephalosporin (i.e. cephalexin) for 10 days. If penicillin related anaphylaxis, then use clindamycin or clarithromycin for 10 days, or azithromycin for 5 days (strong, moderate). Note: Azithromycin dosing is 12 mg/kg/day for 5 days (max 500 mg).
 - Resistance of GAS to Macrolide agents is well known and varies geographically and temporally. Macrolide resistance rates 5 – 20%. Clindamycin resistance rare ~ 1-3%.
- 6) Adjunctive therapy may be useful in the management of GAS pharyngitis. Analgesic/antipyretic agent such as acetaminophen or Ibuprofen for treatment of symptoms such as control of high fever and sore throat associated with GAS pharyngitis should be considered as an adjunct to an appropriate antibiotic (strong, high). Aspirin should be avoided in children due to the risk of Reye's Syndrome (strong, moderate). Corticosteroid therapy is not recommended (weak, moderate).
- 7) Recurrent episodes of pharyngitis associated with laboratory evidence of GAS pharyngitis may be due to chronic pharyngeal GAS carrier who is experiencing repeated viral infections rather than repeated streptococcal pharyngitis at close intervals (strong, moderate).
- 8) GAS carriers do not ordinarily justify efforts to identify them nor do they generally require antimicrobial therapy because GAS carriers are unlikely to spread GAS pharyngitis to their close contacts and are at little or no risk for developing suppurative or nonsuppurative complications such as acute rheumatic fever (strong, moderate) Clindamycin is recommended for eradication of the GAS carrier.
- 9) Follow-up post-treatment throat cultures or RADT are not recommended routinely. (strong, high). Follow up culture to identify the GAS carrier state may be considered in special circumstances
- 10) Diagnostic testing or empiric treatment of asymptomatic household contacts of patients with acute streptococcal pharyngitis is not routinely recommended (strong, moderate). Test only if symptomatic.
- 11) Tonsillectomy solely to reduce the frequency of GAS pharyngitis is not recommended (strong, high).
- 12) Non-group A strep does not need to be treated as it will not cause the non-suppurative consequences of rheumatic fever, rheumatic heart disease or post glomerular nephritis. Antibiotic Treatment for non-group A strep is indicated if symptoms of sore throat or fever are still present for symptomatic improvement. Treatment regimen is the same as for GAS.

CENTOR CRITERIA

Clinical scoring criteria have been developed to help determine the likelihood of a bacterial cause. The most widely used are the modified Centor criteria, which include:

- fever by history
- tonsillar exudates
- tender anterior cervical adenopathy
- absence of cough

Patients who meet 3 or more Centor criteria have an increased risk of GAS and should have a strep test. If fewer than 3 Centor criteria are present then the patient does not need to be tested.

Clinical features alone do not distinguish between GAS and viral pharyngitis.

The American College of Physicians (ACP) - *Clinicians should test patients with symptoms suggestive of group A streptococcal pharyngitis (for example, persistent fevers, anterior cervical adenitis, and tonsillopharyngeal exudates or other appropriate combination of symptoms) by rapid antigen detection test and/or culture for group A Streptococcus. Clinicians should treat patients with antibiotics only if they have confirmed streptococcal pharyngitis.*

CDC Pediatric Treatment recommendations – *Testing should not generally be performed in children younger than 3 years in whom GAS rarely causes pharyngitis and rheumatic fever and subsequent rheumatic heart disease) is uncommon. In children and adolescents, negative RADT tests should be backed up by a throat culture and positive RADT's do not require a back up culture.*

Table 1: Antibiotic Regimens Recommended for Group A Streptococcal Pharyngitis

Drug Route	Dose or Dosage	Duration or Quantity	Recommendation Strength, Quality
<i>For individuals without penicillin allergy</i>			
Penicillin V, oral	<27 kg : 250 mg 2 or 3 times daily; >27 kg 500 mg twice daily	10 days	Strong, high
Amoxicillin, oral	50 mg/kg once daily (max = 1000mg); alternate: 25 mg/kg (max = 500 mg twice daily)	10 days	Strong, high
Benzathine penicillin G, intramuscular	<27 kg: 600,000 units; >27 kg: 1,200,000units	1 dose	Strong, high
<i>For individuals with penicillin allergy</i>			
Cephalexin, oral *	20 mg/kg/dose twice daily (max = 500mg/dose)	10 days	Strong, high
Cefadroxil, oral*	30 mg/kg once daily (max = 1 g)	10 days	Strong, high
Clindamycin, oral	7 - 10mg/kg/dose 3 times daily (20-30 mg/kg/day) (max = 300mg/dose)	10 days	Strong, moderate
Azithromycin, oral**	12 mg/kg once daily (max = 500mg/day)	5 days	Strong, moderate
Clarithromycin, oral**	7.5 mg/kg/dose twice daily (max = 250mg/dose)	10 days	Strong, moderate

Abbreviation: max, maximum.

*Avoid in individuals with immediate type hypersensitivity to penicillin.

**Resistance of GAS to these agents is well known and varies geographically and temporally. Macrolide resistance rates 5-20%. Clindamycin resistance rare, ~1-3%

PATIENT EDUCATION

Choosing wisely: <http://consumerhealthchoices.org/choosing-wisely-report/antibiotics-for-respiratory-illness-in-children/>

DEFINITIONS

Antibiotic stewardship refers to coordinated interventions designed to improve and measure the appropriate use of antimicrobials by promoting the selection of the optimal antimicrobial drug regimen, dose, duration of therapy, and route of administration. Antimicrobial stewards seek to achieve optimal clinical outcomes related to antimicrobial use, minimize toxicity and other adverse events, reduce the costs of health care for infections, and limit the selection for antimicrobial resistant strains. - See more at: https://www.idsociety.org/Stewardship_Policy/
